

# SQUARING POLES

**The Fastest and Easiest Way to Verify Proper Window and Door Installation**

Squaring Poles are telescoping aluminum tubes used to measure windows and doors to make sure they are installed square.

Squaring Poles come in sets of two different sizes for measuring a wide range of windows and doors.

Standard: 42" to 77"  
Extra Large: 72" to 137"

Optional Small Size Poles Now Available  
Measures 28" to 48"

The poles have an anodized finish and feature adjustable collars which allows tension of slide to be adjusted and locked into place.

Poles are marked with inch and metric scales graduated to 1/16<sup>th</sup> of an inch and one millimeter.

Ends of Squaring Poles have pivoting blocks that allow poles to fit snugly into corners for accurate measurements.

Improper installation is one of the main reasons for problems with windows and doors.

Squaring Poles allow one person to easily and accurately check almost any size window or door to ensure that it is installed square.

**NOTE:** Scales on poles are calibrated with end blocks square to pole. Measurements are not absolute when poles are used with end blocks at angle to pole. Angled measurements are for comparison only.

## To Use Squaring Poles:

Use Squaring Pole to measure window diagonally, from corner to corner

Next measure opposite corners

- If measurements are equal, window is square.
- If measurements are not equal, the difference is the amount the window is out of square.
